

Wizard2011

Executable Information							
<div>Information Close</div> <p>Add information about the execution of your tool here. The executable type describes how your tool will be integrated on the BiBiServ (e.g. as a Java-class or a plain binary). The calling information is the "prefix" of any command line call of your tool without its path (e.g. in the call "myTool -e -f" this prefix would be "myTool"). You also have to type in the current version of your tool.</p> <table><tbody><tr><td>Executable type: *</td><td><input type="text" value="binary"/></td></tr><tr><td>Calling information: *</td><td><input type="text" value="testtool"/></td></tr><tr><td>Version: *</td><td><input type="text" value="1.0"/></td></tr></tbody></table> <div>Return Save and return Save</div>		Executable type: *	<input type="text" value="binary"/>	Calling information: *	<input type="text" value="testtool"/>	Version: *	<input type="text" value="1.0"/>
