Wizard2011

Function

Information   Close

This is the main window to create a new function. You have to type in a name, short description and description for each new functionality you want to describe. Also you have to define the output of this functionality. On the right side of the screen you can see an overview containing all descriptions of functions, inputs, outputs, parameter groups and dependencies you have created already. If you want to use one of these created items for your current function description, just select it in the respective dropdown menu. If you want to edit the order of the parameters, inputs and outputs in a command-line call of this functionality please use the "Edit order"-button. If you want to set up an example for this functionality BiBiServ-users can use to get a better understanding of what your tool does please use the "Edit examples"-button. If you want to create new descriptions of functions, inputs, outputs, parameter groups or dependencies please use the respective "+" button on the right side of the screen. A parameter group is a wrapper structure that contains all descriptions of parameters of a given functionality (or even other parameter groups). A dependency description defines dependencies between different parameters (e.g. that a given parameter may not be defined if another one is defined). Please note that if you use the buttons to create a new function or edit an existing one your current function is not saved!

Name: *

Short Description: *

Description: Open Text-Editor

Inputs: Choose an input ▼ +

Output: *   Choose an output ▼

Parameter group: Choose parameter group ▼

Dependencies: Choose dependency ▼ +

Order: Edit order

Examples: Edit examples
