Wizard2011

create XML

Information	Close

This site provides functions for generating an output xml-document of your tool description as well as generating web-pages and java-classes for deployment of your tool on the BiBiServ2 using codegen. The output-xml will be a valid tool description according to the BiBiServAbstraction schema and will be saved in .bs2 format. Please note! If you change anything to your tool description, you have to use the "create XML" button again! A created .bs2 description can be loaded into the Wizard again. Therefore this function makes it possible to save your current working state. After finishing the .bs2 creation you can start the codegen process using the "Create Code" button. This process will create a functioning set of web pages and Java backing beans as a NetBeans-Project that is compatible with BiBiServ 2. You can download the generated project as a .zip-file. There are several options for code creation that manipulate which pages and functionalities are created for your tool. Please do not use these options if you don't know what you are doing.

The xml-file was successfully created.

Start: create XML

.bs2-File: Download

Options: Without WebService: ☐

Without Moby: ☐

Without Virtual BiBiServ: ☐

Without sswap: ☑

Create Code: Create Code
